THE SUMMIT OF THE EARTH.

Up in the porthern Catakills there is a rock which the guides ca'l "Prospect Point," whose summit affords a wond rful view of the surrounding highands. You can see the Berkshire Hills son, and far in the north the blue reights of the Adirondacks with the ome-like summis of Mount Marey, the highest mountain in the State of New York. At sunrise the top of that dome often fooms like a huge blue coud above the have of the horizon, and considering its distance from the Catskills, it seems strange that the height of such a lofty summit is hardly one-fourth of the altitude attained by several extiact volcanoes in the Sierras of Eastern Cali-

nounta'n whose elevation exceeds that of the highest Cali ornia peaks by not less than twelve thousand feet, and whose top, if it could be transported to New York, would tower above the ridge of the Adirondacks I ke a tall pine-tree above a colipice of hawthorn and ha el bushes. Mount Everest the Everest moves slowly over the table English surveyors have named that summit of the earth, but the natives call it the Nunaghir-the "Ahode of Light," because the morning sun gilds its crest a full hour before the first glimmering of dawn reaches the valleys of the foothills. The best view of its gigantic peak can be obtained from the rocks above the delile of Kaskan, which crosses the main ridge of the Himalaya o the road from Thibet to Northern

India. The Himalaya foothills are clothed with forests of sago-palms, manges and other tropical trees; eight thousand feet higher up the vegetation resembles that of Northern Canada, and where the last lwarf pines dwindle to mere shrubs. the traveler is still several thousand feet below the highest point of the pass. But that height itself is only a hallway station of the snow region: where tiers of icy precipices rise from the tableland up to a sidge that stretches away to the east, and culminates in a supendous double pyramid of everlasting snow,

the tourist who has learned to heave the dangers of the glacier-cie ts. From the ridge of the plateau which has been called the "Root of the World," some fifteen thousand squa o miles of los-felds and snow-peaks are in sight, and in spring-time the echo of the ava-lanches resembles the roll of contin-uous thunder. In midsummer, too, large masses of mingled rocus and ice detach themselves from the cliffs, and in the clear air of the higulands their descent over the steep mountain-sides in the clear air of the highlands their descent over the steep mountain-sides can sometimes be observed from such a distance that a full minute passes before the reverberation of the hills announces the fall of the ponderous rocks. From the higher ridges the mountaineers hear now and then a sound that resembles the echo of a distant explosion, whose origin, never fully explained, is the subject of many fanciful speculations. It is supposed that the influence of the warm summer days alternating with the colding it a expands the lee-crust of the glacites till the strain overcomes its glacites till the strain overe lands. You can see the Berkshire Hills power of resistance and splits it assuogg. It is certain that the cre-asses, or clofts, in the upper glaciers often reach down to the very bottom of the ice-mass, with a horizontal extension of ten or twelve thousand vards. People who have heard the whip-like crank produced by the breaking of the ice on produced by the breaking of the ice on a frozen river may imagine the detona-t on when a mountain of solid ice bursts open for a distance of seven English miles. Hard winters conqual these clefts with a cover of snow, and make the passage of the glaciers extremely dangerous; but it must be a wonderful

> ing pillars, and often seem to dance to gether like specters in fluttering winding sheets. On clear days the shadow of Mo lands of Thibet, and tifty miles north of the Himalayas there are valleys whose inhabitants fear the south wind whose inhabitants fear the south wind (coming straight from the key high-lands) as the people of our prairie States dread a northwest gale. The shadow of the Nunaghir is their sundial, and in mid-summer its snowy peak is almost constantly in view, as a white pyramid in daytime and as a luminous present during the larger part of the pyramed in daytime and as a luminous beacon during the larger part of the night, for in June the rays of the sun linger on its crest till after ten o'clock.

sight when the storm wind raises the snow in drifts that send over the lea-fields in the form of funnels and whiri-
